

INTERNATIONAL CONFERENCE ON NEUROSCIENCE AND MENTAL DISORDER

JUNE 29-30, 2023 | (Mercure Roma West Rome, Italy)

Prof. Lorena Menditto, Ph.D.

Department of Human Science, LUMSA University, Rome

The tyrannie of empathy. Analytics think in the pro-activity human brain

The research EP-1 aims to be an invitation to all therapists not to slip on the smooth and slippery walls of the tyrannie of empathy, and to ensure that synchrony with the patient is a way to look inside the story, an Unbergriff, ie a concept of lack that generates desire, from which $X = f(\text{One})$ and not just a diachrony, i.e. a concatenation of time over the time. Synchrony is not only what happens to us, but what is said together. The understanding of the interpersonal dimension is closely related to the intra personal dimension as these two dimensions are activated neuro biologically from the same areas of the brain. This justifies a certain ideological correspondence on the subject we are dealing with as the brain engages in self-referential activities using brain areas seen as noble, which are the same resources it uses for understanding the mind of the other. This dual overlap between the neurobiological plane and the ideological plane was the leitmotiv of this study, which I encapsulate in this mathema:

$\Delta = (\text{sinc.} + nA + nB + \text{therapyroom} + \text{empathy}).$

Keywords: Empathy, EP-1, desire, cerebral interconnection, amigdala, therapist's schibbolet, psychic experience and neuroimaging ?

Biography:

Lorena Menditto is a Professor at LUMSA in Rome. In 2019 she obtained a Master's degree in Psychoncology at the Catholic University of Rome and an internship at the Department of Senology in Pisa. For years she has been studying the brain interconnections related to the clinical and epigenetic aspects of trauma. she also did research in the following areas: studies on mother-child relationship, life cycle, studies on empathy, specific learning disorder and social cognition
